No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                           Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      멂
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence of the peptide shown in AAR72739 corresponds to the C-terminal sequence of both the mouse and the human ribonucleotide reductase (RR) R2 subunit. The acylated form of the peptide is an inhibitor of mammalian RR activity (IC50 = 10-20 microM on mouse R2). Various peptides (including the present peptide, AAR72768) were prepared in acylated and non-acylated form and assayed for inhibitory effects on mammalian RR, compared to AAR72739. It was found that the acylated form of the peptide given in AAR72740 was 8-16 times less potent an inhibitor and was also found to specifically inhibit RR activity of Plasmodium falciparum. It is thus a preferred peptide of the invention, having antimalarial activity with little inhibitory effect on mammalian (including human) ribonucleotide reductases. The acylated form of the present peptide had an IC50 value of 40-42 microM against mouse recombinant RR R2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       JT,
s AAW70114, AAW70142-W70154 are N-terminal amino acid sequences dees generated by chymotrypsin/trypsin digestion of the 45 kDa Mpp protein. These sequences were obtained by purifying the 45 kDa digesting it with chymotrypsin/trypsin, and then separating the by reversed-phase HPLC on a column. All of the peptides were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              produced by chymotrypsin/trypsin digestion

                                                                                                                                                                             Peptides AAW45983-W456025 are based on portions of somatostatin, somatostatin receptors (SSTR) and insulin-like growth factor binding proteins (IGFBP). They are capable of increasing weight gain, birth weight, growth rates, milk production, levels of circulating insulin, IGF-I and IGF-III, fibre production and muscle weight. They may be used to modulate carbohydrate metabolism and in treatment of diabetes. The oil carrier may be used for delivery of the peptides.

                                                                                                                                                                               Arabidopsis acetohydroxy-acid synthase (AHAS) small subunit is needed CC for branched-chain amino acid synthesis and so is essential for life. CC AHAS is also known as acetolactate synthase. Inhibition of this enzyme CC in plants would lead to plant death and therefore inhibitors would be potential herbicides. Certain herbicides are known to inhibit AHASs: CC imidazolinones, sulfonylureas, triazolpyrimidine sulfonamides. CC pyrimidyl-cvy-benzoic acids, sulfamoylureas and sulfonylureatoxamides. CC Mutant AHAS may be resistant to these herbicides and may be used to CC create herbicide resistant transgenic plants e.g. dicot and monocot crop CC plants. A thrombin cleavage site was incorporated into an AHAS small companies. A thrombin cleavage site was incorporated into an AHAS small companies. A thrombin cleavage site was incorporated into an AHAS small companies. The glutathione CC transferase was then cleaved via the thrombin cleavage site. Cleavage transferase was then cleaved via the thrombin cleavage site. Cleavage companies, in that the glycine and serine residues of the cleavage site CC are maintained on the AHAS protein. The present sequence details the CC are maintained on the AHAS protein. The present sequence details the CC are maintained on the AHAS protein and serine residues of the cleavage site CC are maintained on the AHAS protein. The present sequence details the CC and filarion due to cleavage.

                                                                                                                                                                                                                                                      The invention relates to a composition comprising a peptide inhibitor of ribonucleotide reductase. Peptides AAY83838-Y83864 represent examples of the inhibitor peptides used in the composition. The peptides are synthesised based on the sequences of known mammalian, bacterial and viral ribonucleotide reductases. The compositions are used in the treatment of disorders associated with DNA replication, such as tumour growth and metastasis and infectious disease, such as those caused by viruses, bacteria, fungi and parasites.

                                                                                                                                                                                                                                                                                                                      γ
                                                                                                                                                                                                                                                                                                                                                                                                                             CC mycobacterial disease or infection comprises assaying a biological fluid CC sample for the presence of early antibodies specific for an 88 kpa CC Mycobacterium tuberculosis (Mt) protein or immune complexes consisting of CC an 88 - kpa M tuberculosis protein antigen or immune complexes consisting of CC specific for the antigen. The method is useful for the antibody CC detection of mycobacterial disease, particularly tuberculosis, in CC individuals at heightened risk of developing tuberculosis (TB). This CC individuals include human immunodeficiency virus (HIV)-infected subjects or other immunocompromised individuals. The method is a rapid and CC inexpensive screening procedure for detecting mycobacterial disease. CC The present sequence is the N-terminal amino acid sequence of CT27 CC glycopeptide. The N-terminal appetide is identified by fast atom CC sequence analysis of peptides generated by proteolysis of the Mt 45 kba/MPT 32 glycoprotein with chymotrypsin/trypsin. The Mt 45 kba/MPT 32 early antigen is used in the serodiagnosis of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                       Matches

This in vivo panning method typically involves administering a phage display library to a subject, and identifying expressed peptides which home to the desired organ or tissue. The isolated peptides which vascular tissue or tumour tissue. The isolated peptides (see AAW13412-52, AAW1181-86) can be used to target e.g. drugs, toxins o labels to the selected organ/tissue (claimed) or to identify and/or isolate target molecules (claimed): The peptides can be directly methods, which require further examination to see if they maintain specificity in vivo.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                                                                           or identifying the risk of a subject developing cancer (especially breast cancer), or monitoring the effect of therapy on a subject with cancer, comprising analysing a test sample using two-dimensional electrophoresis and detecting Breast Cancer-Associated Protein Isoforms (BPIs). The methods disclosed are used for the diagnosis and prognosis of breast cancer, for determining the severity of breast cancer, and for identifying a subject at risk of developing breast cancer, and monitoring the effect of therapy administered to a subject. Antibodies raised against the binding domain of a BPI, the binding domain of a BPI, a nucleic acid encoding a BPI, or a nucleic acid that inhibits the function of a BPI can be incorporated into a pharmaceutical
                                                                                                   composition for treating or preventing breast cancer. The methods use sensitive and specific biomarkers provide early diagnosis of breast cancer, and the compositions are more potent, specific, and has a more rapid effect with fewer side effects that other prior art methods. The present sequence is a tryptic digest peptide from a BPI of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an enriched library fraction containing molecules that selectively home to a selected organ or tissue such as brain, kidney or tumour recovered by in vivo panning. The invention generally relates to the field of molecular medicine, drug delivery and to a method of invivo panning for identifying a molecule that homes to a specific organ. The molecules, e.g., peptides, peptidenmetics, proteins and fragments of proteins contained in an enriched library fraction may be administered to a subject as part of a pharmaceutical composition to rest disease or in diagnostic methods. The present sequence is a peptide from bacteriophage targetted to brain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Enriched library fraction comprising molecules recovered by in vivo panning that selectively home to a selected organ or tissue useful for treating disease or in diagnostic methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 2; Column 17; 21pp;

                                                                                                                                                                                                                                                                                                                                                               The present invention relates to methods and compositions for the CC screening, diagnosis or prognosis of Alzheimer's disease (AD) in CC a subject. The method comprises analysing a sample of brain tissue from a subject by 2D electrophoresis to generate a 2D array of.
CC Alzheimer's disease-associated features (ADFS), whose relative CC abundance correlates with the presence, absence, stage or severity of CC that chosen feature in brain tissue from persons free from AD. The CC invention also describes Alzheimer's disease-associated protein CC invention also describes Alzheimer's disease-associated protein CC compositions of the invention are useful for the screening, diagnosis CC or prognosis of AD in a subject, for identifying's subject at risk of developing AD, CC or for monitoring the effect of therapy administered to a subject having AD. Antibodies capable of binding to ADPIS are useful for treatment regime. An agent that modulates the activity of ADPI is cuseful in the manufacture of a medicament for the treatment or CC prevention of AD in a subject. ABG67292-ABG68038 represent human ADPI ax

                                                                                                                                                                                                                                                                                                                                                                                                         ρy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             comparison and the present at the method comparison administering to the subject the library of diverse molecules, collecting a sample of the selected organ or tissue (e.g. brain or kidney), and recovering from the seample several molecules that home to the selected organ or tissue (c.g. brain or kidney), and recovering from the sample several molecules that home to the selected organ or tissue. CC The method is useful for identifying molecules, particularly useful for cs screening large number of molecules (e.g. peptides), that home to a specific organ. The identified molecule is useful for e.g. raising an CC e.g. drug, toxin or detectable label) to the selected organ. CC specifically, the method is useful for identifying a desired molecule organ to a subject by linking an appropriate moiety to a tumour homing consciule. The present method provides a direct means for identifying CC molecules that specifically home to a selected organ and, therefore provides a significant advantage over previous methods, which require that a molecule identified using an in vitro screening method considered to examined to determine if it maintains its specificity in the present method provides a direct mointains its specificity in the present method to determine if it maintains its specificity in the present method is useful for the selected organ and, therefore that a molecule identified using an in vitro screening method to determine if it maintains its specificity in the present method provides a significant advantage over previous methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-b1) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-b1 and/or its receptors. Peptides AAY92945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis.

                                                                                                                                                                                                                                                                                                      Penicillium purpurogenum variety rubrisclerotium; endo-inulinase; inulo-oligosaccharides; inulin; peptide fragment 175-184.
                                                                                                                                                                                                                                                                                                                                                    Penicillium purpurogenum endo-inulinase peptide fragment 175-184
                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAR72570 standard; Peptide; 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             immunosuppressive, notropic, antiarteriosclerotic, antinicrobial, antilulcer, antiallergic and neuroprotective activities. The antagonists are useful in the treatment of an inflammatory disease or disorder, e.g. an autoimmune disease, diabetes, multiple sclerosis, rheumatoid arthritis, myasthenia gravis, systemic lupus erythematosis, chronic inflammation, atherosclerosis, inflammatory bowel disease, reactive arthritis, chronic infections, graft rejection, gingivitis, gastritis, ulcer, thrombosis, allergy and acute infections. AAH43896 to AAH43899 and AAB99542 to AAB99673 represent sequences used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes anti-inflammatory peptides of heat shock protein hsp60, which are capable of acting as antagonists of hsp60 characterised by their ability to reduce or prevent the induction of a pro-inflammatory immune response of cells of the innate immune system by hsp60. The peptides have antiinflammatory, antidiabetic, antirheumatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anti-inflammatory peptides of hsp60, which are capable of acting as antagonists of hsp60, useful for treating an inflammatory disease or disorder, e.g. an autoimmune disease, diabetes, multiple sclerosis and

                                         AAW61058-60 represent partial aminolacid sequence of different immunoglobulin (Ig) molecules. The specification describes a non-naturally occurring IgG having an altered amino acid sequence compared to native IgG, which binds to FCRN with increased or decreased affinity. FCRN is a receptor found on the intestinal surface of the meonate and is responsible passage of maternal milk IgG from the intestinal lumen to the systemic circulation via the intestinal epithelial cells. FCRN is also used to prevent clearance of circulating IgG from the circulation. Altering the binding site on an IgG for FCRN allows greater or lower affinity for the FCRN receptor, which subsequently increases or decreases the half-life of circulating IgG, respectively. IgG's with an increased half-life can be used to treat immune conditions or diseases such as idiopathic thrombocytopaenic

                                                                                                                                                                                                                                                                                                       The invention relates to the identification of complementary peptides by analysis of protein and nucleotide sequence databases from higher eukaryotic genomes, excluding human and plants. The specific complementary peptides interact with their relevant target proteins encoded in the eukaryote genome. The peptides may be used as reagents and drugs for drug discovery and as lead ligands for drug design and development. The present sequence is a complementary peptide from
Hepatotropic; antagonist; transforming growth factor betal; TGF-bl; competitive inhibition; collagen synthesis stimulation inhibitor; liver;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY93945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease. specifically cirrhosis

                                            Peptides that antagonize binding of transforming useful for treatment of liver disease, especially partial sequences of the factor or its receptors
                                                                                                                             Ezquerro Saenz
Borras Cuesta I
                                                                                                                                                                                                                                                                                                                         Hepatotropic; antagonist; transforming growth factor betal; TGF-bl; competitive inhibition; collagen synthesis stimulation inhibitor; lextracellular matrix degradation inhibitor; mimetope; cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY92945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of
                                                                                                                                                                     (CIEN-)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                      The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-b1) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-b1 and/or its receptors. Peptides AAY92945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis.
                                                                                                                                                                       The invention relates to of transforming growth
                                                                                                                                                                                                                       Disclosure; Page 27; 86pp; Spanish.
                                                                                                                                                                                                                                                  Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors -
                                                                                                                                                                                                                                                                                                                                                         Ezquerro Saenz IJ,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hepatotropic; antagonist; transforming growth factor betal; TGF-b1; competitive inhibition; collagen synthesis stimulation inhibitor; liver; extracellular matrix degradation inhibitor; mimetope; cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY92945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of

                                                                                                                                                                                                                                           The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides ANY22945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hepatotropic; antagonist; transforming growth factor betal; TGF-bl; competitive inhibition; collagen synthesis stimulation inhibitor; l extracellular matrix degradation inhibitor; mimetope; cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors -

                                                                                                                                                                                                                                                                                                     a function naturally performed by the corresponding yeast pheromone system protein; and (b) a second heterologous gene encoding a heterologous peptide, where the heterologous peptide modulates the interaction of the surrogate with the pheromone system in the yeast cell, and the modulation is a selectable or screenable event. The yeast cells are used in assaying a peptide for modulation of the activity of a non-yeast surrogate for a pheromone system protein and determining by detecting a change in the selectable or screenable event whether the pheromone signal pathway is activated or inhibited by the interaction of
                                                                                                                                                                                                                                                                 of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a yeast cell having a pheromone system, in which the cell comprises: (a) a first heterologous gene encoding a heterologous surrogate of a yeast pheromone system protein, the surrogate being a kinase and performing in the pheromone system of the yeast cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Recombinant yeast cells - con system protein surrogate and

The invention relates to yeast cells engineered to express an exogenous protein capable of substituting for a yeast protein involved in the post-translational modification, transport, recognition or signal transduction of a yeast pheromone. The system can be used to identify drugs which inhibit or activate the ability of the surrogate to substitute for the cognate yeast pheromone system protein. Inhibitors of farnesyl transferase identified can be used for anticancer therapies.

The present invention describes recombinant yeast cell mixtures (I). CC Each (I) has a heterologous G protein coupled receptor (GPCR) expressed cc in the cell membrane such that signal transduction (ST) activity via CFCR is modulated by interaction of extracellular region (ER) of GPCR with a heterologous polypeptide (P) which interacts with ER of receptor. CC Modulation of the ST activity by (P) provides a detectable signal. CC Also described is a recombinant yeast cell (II) that has a cell membrane CC which comprises a GPCR such that ST activity via GPCR is modulated by CC interaction of an ER of GPCR with an extracellular signal, and a (P) which is transported to a location allowing interaction with ER of GPCR. CC (I) is used for identifying a modulator of (P) expressed by the yeast cell which involves providing (I) which comprises heterologous GPCR and CC a heterologous test polypeptide, allowing the cells within the mixture to generate a detectable signal and then identifying the heterologous cest peptide as a modulator of the heterologous receptor protein CC expressed by the yeast cell. The yeast cells may be used to identify of the surrogate to substitute for the cognate yeast pheromone system CC the surrogate to substitute for the cognate yeast pheromone system contains. The yeast cell is also used to screen agonists and antended to screen agonists and seventhic that the exemplification of the protein surrogate to substitute for the cognate yeast pheromone system contains. The present sequence is used in the exemplification of

The assay uses a mixture of recombinant cells, each comprising a receptor protein whose signal transduction activity is modulated by an interaction with an extracellular signal, a recombinant gene encoding a potential receptor polypeptide, and a reporter gene construct. The assay is useful for rapid screening of large numbers of polypeptides to identify polypeptides antagonizing or agonizing receptor activity, and to identify drugs for modulating cellular activity. It is especially useful to identify ligands for orphan receptors, especially ligands for orphan cell surface receptors, which are useful in drug discovery. The present sequence represents an alpha-factor pheromone agonist, which was identified using the assay of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          05-JUN-1995;

The method comprises rapidly screening large numbers of polypeptides in a yeast expression library to identify those polypeptides which induce or antagonise receptor bioactivity. The method is useful for screening and identifying pharmaceutically effective compounds that specifically interact with and modulate the activity of a cellular receptor or ion channel. The assay is particularly amenable for identifying surrogate ligands for orphan receptors. The present sequence represents a Ste2 agonist, identified from an alpha-Mid-5 library, using the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       or transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides ARY92945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the nentides are word for the collagen synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hepatotropic; antagonist; transforming growth factor betal; TGF-bl; competitive inhibition; collagen synthesis stimulation inhibitor; l extracellular matrix degradation inhibitor; mimetope; cirrhosis.
  The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY92945-Y93133

             The present sequence is a peptide encoded by one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis.
                                                                                    The present invention relates to oligonucleotides (see AAL26793-AAL34 encoding polymorphic variants of proteins related to amylases, amylois proteins, angiopoietin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, cinterferons, interleukins, G-protein coupled receptors and thioesteral proteins.
                                                                                                                                                                                                                                        Polymorphic nucleic acids encoding oncogenes and histones, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Homo

interferons, interleukins, G-protein coupled receptors and thioesterases. The present sequence is a peptide encoded by one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukaemia), diseases of the nervous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   amyloid protein; angiopoletin; apoptosis related protein; cadherin; cyclin; polymerase; oncogene; histone; kinase; colony stimulating factu complement related protein; cytochrome; kinesin; cytokine; interferon; interleukin; G-protein coupled receptor; thioesterase; inflammation; multifactorial disease; autoimmune disease; infection; nervous system disease.
                                                                                                                                                                                                                                                                                                                   The present invention relates to oligonucleotides (see ALI26793-AALI34659) encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoletin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, complement related proteins, cytochromes, kinesins, cytokines,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polymorphic nucleic acids encoding e.g. amylases, oncogenes and histones, useful for diagnosing and cancer, autoimmune diseases and infections -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SS
                                  An antigenic conjugate, useful as a vaccine for AIDS, has the formula (SpNE)n-(OMPC), where SPNE is a selected principal neutralisation epitope of HIV, which is one of 27 specified polypeptides (including the present sequence) or their fragments containing at least 5 amino acids and including the DRW or DKW region; OMPC is purified outer membrane proteosome of Neisseria (pref. N. meningitidis); and n is 1-200, indicating the number of SPNE moieties covalently linked to the OMPC. The conjugates may be substituted by anions, and conjugation may be via a bigeneric spacer. The SPNE polypeptides bind an HIV broadly neutralising monoclonal antibody (2F5 antibody) specific for the ectodomain of HIV gp41 transmembrane glycoprotein. They were originally identified in the screening of phage epitope libraries having the library used was library ALPHA described in AAR83295. The sequences of these polypeptides were deduced from their corresponding DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                  Ş
                                                                                                                                                                                         The present sequence is that of a D3 peptide derived from human CC inhibits endothelial cell proliferation and thus possesses anti-angiogenic activity. It is an example of D3 peptides of the CC invention (see AAY95405-26) that are analogues of certain sites in CC and in which native cysteine residues may be replaced by alanine CC may also induce endothelial cell apoptosis. Compositions including CC the peptides are used in calamed methods for inhibiting angiogenesis, can indicate the peptides are used in claimed methods for inhibiting angiogenesis, cell apoptosis. Concer, rheumatoid arthritis, and ocular disorders The TC50 value for the present peptide was 42 um for inhibition of the retina are treated. The TC50 value for the present peptide was 42 um for inhibition of the retina are treated.

The human secreted proteins can have activities based on the tissues and cells they are expressed in Examples of the activities are: neuroprotective; nootropic; neuroleptic; antimanic; cerebroprotective; immunomodulatory; neuroleptic; antimanic; cerebroprotective; immunomodulatory; anti-microbial; cardiant; cytostatic; antinflammatory; haemostatic; anticonvulsant; and vasotropic. The polynucleotides and proteins may be used to prevent, treat or ameliorate a medical condition, e.g. by protein or gene therapy. Conditions treatable by the proteins of the invention include neural, reproductive, or immune disorders, especially lambunodeficiency, infection, lymphomas, demyelinating diseases, auto-immunities, cancer, general microbial infection, inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           aneurysms and haemorrhages. Specific examples include: Alzheimer's disease; Parkinson's; Huntington's; Tourette syndrome; multiple sclerosis; meningitis; ischaemia; prostate cancer; mania; dementia; obsessive compulsive disorder and viral prophylaxis. The polynucleotides and proteins can also be used in the detection of disorders associated with the function of the protein, for example, the detection of developmental disorders, sexually-linked disorders, or disorders of the cardiovascular system. They may also be used as food additives or preservatives. AAA26272 to AAA26280 and AAV91345 are sequences used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Moore PA,

AXY AAX97916 to AAX98029 represent 110 isolated human secreted protein CC genes. AAY36224 to AAY36727 represent the secreted proteins encoded by the 110 human genes. The genes and their corresponding secreted CC polypeptides are useful for preventing, treating or ameliorating medical CC conditions, e.g. by protein or gene therapy. Also pathological conditions CC can be diagnosed by determining the amount of the new polypeptides in a CC sample or by determining the presence of mutations in the new genes. CC specific uses are described for each of the 110 genes, based on which CC tissues they are most highly expressed in, and include developing CC products for the diagnosis or treatment of cancer, tumours, developmental abnormalities and foetal deficiencies, blood disorders, developmental CC immune system, autoimmne diseases, inflammation, allergies, Alzheimer's CC and cognitive disorders, schizophrenia, arthritis, asthma, psoriasis, CC sepsis, skin disorders, atherosclerosis, diabetes, cardiovascular CC disorders, kidney disorders, digestive/endocrine disorders, infections CC and AIDS. The polypeptides are also useful for identifying their binding CC partners. The sequences given in AAX97907 to AAX97915 and AAY36223 are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Carter KC, L

This GA binding protein (GABP) consists of two separable subunits. Applicants have isolated cDNA clones encoding both subunits of GABP and have revealed that one (GABP alpha) is related to the Ets series of 33-amino acid repeats related in sequence to a variety
